Front-end Test Task

Task
Develop a Single page application with following mentioned features but not necessarily limited to it.

#Must:
1. Display a list of customers (with pagination).
2. Each customer bas several bids, by default only the maximum bid should be displayed. Also add a toggle button so that on switching toggle only the minimum bid is displayed.
3. Enable sorting of customer list by bid amount.
4. Front-end part should be developed as SPA with ES6, React(Hooks).

#Good to have:
1. Using Context Api or Custom Hooks will be a big plus.

2. Clicking on any row should redirect to a separate url where all the selected customer's bids should be displayed. (use your creativity on how to display the data).

3. Styling is not a priority but using Material Ui(https://material-ui.com) entirely will be a plus.

Use following API to retrieve the data - `https://intense-tor-76305.herokuapp.com/merchants`

Data structure example

Customer {
  id: string,
  firstname: string,
  lastname: string,
  avatarUrl: string,
  email: string,
  phone: string,
  hasPremium: boolean,
  bids: Array<Bid>
}

Bid {
  id: string,
  carTitle: string,
  amount: number,
  created: string
}

Table expected

_____
| Customer name (with avtar) | Email | Phone | Premium | Max/Min bid |
_____
